

WELCOME PATIENTS

Your health practitioner is recommending the use of an AmDrop™ Amniotic Fluid to treat your condition. The information in this pamphlet is designed to anticipate and answer any questions you may have regarding AmDrop™ and the procedure.

AmDrop™
Regenerative Therapy

DOCTOR INFO

What is AmDrop™?

AmDrop™ is a biological structure composed of human amniotic fluid (placental tissue) – used by health practitioners to safely and effectively treat sexual dysfunction issues, incontinence and promote the healing and regeneration of a host of other conditions.

What is Human Amniotic Fluid?

Human amniotic fluid is the amniotic sac during pregnancy. Amniotic Fluid contains growth factors and rich cytokines that, when injected into the body, promote healing and pain management.

Is AmDrop™ comfortable?

Yes. The major advantage of the AmDrop™ technology is its ability to effectively treat the condition– while enabling the patient to maintain a comfortable, functional, high-quality lifestyle.

Is AmDrop™ safe?

Yes. The safety and quality of each AmDrop™ is carefully controlled. Each AmDrop™ graft provided to health practitioners follows stringent FDA regulations and requirements.

What types of conditions are treatable with the AmDrop™?

AmDrop™ is often used as part of a treatment regimen to successfully combat sexual dysfunction in both male and females as well as other regenerative applications such as Hair Restoration, Wound Care, and Orthopedics.

What clinical benefits have been shown with AmDrop™?

AmDrop™ has been shown to reduce inflammation, promote healing, and enhance comfort.

How long has AmDrop™ been used by Healthcare Practitioners?

For several decades, doctors throughout the world have used amniotic membranes to treat a variety of disorders and conditions.

Benefits of Using AmDrop™

The components of AmDrop™ have been shown to activate the body's own healing response, which is characterized by minimal inflammatory activity and regenerative rather than scar-mediated healing.

AmDrop™ is a protein-rich fluid with proven regenerative potential. Its components regulate and maintain regenerative tissue processes.

AmDrop™ has a complex array of inherent growth factors and cytokines that provide protection to the fetus during pregnancy. Because of its inherent anti-inflammatory and anti-scarring properties, AF has been successfully used clinically as an additive for surgical applications associated with soft tissue procedures. To ensure that these inherent properties are maintained during processing and preparation for clinical implantation, testing must be performed.
