

Amnio Fluid Flow™ Treatment Outcomes

Dec 21, 2018

- Early 40's male
- Fireman
- History is “normal health typically associated with 30/40-year-old males”
- Scheduled Vasectomy
- Post-surgery infection necessitated the removal of one testicle
- Urination and erections became too painful; often causing nausea and vomiting
- Pain lasted for over a year, severely limiting many of his normal life duties
- Patient was treated with Fluid Flow™ injections directly into the penis shaft
- Three weeks post-treatment patient was able to urinate with much less stinging/burning
- Three weeks post-treatment patient also was able to resume sexual functions with much less pain. Feeling and sensitivity has also been partially restored.

Patient states in his own words:

Living with ED is painful, mentally, physically & emotionally. Thank you so much, for all the work, you have done with me & for me through this opportunity for healing with the use of Amniotic Fluid.

Results so far have been varied. Urinating is definitely not as painful. It would burn/ sting about 90% of the time usually. Now I'd say it's about down to 30-40% of the time. Plus, even when it hurts, it's not that bad.

Saving the best for last, I did have sex this past week with my wife & though the physical feeling was very muted; I was able to feel pleasure & I DID NOT have any pain.

Big WIN!!

An additional treatment, for even greater results is on the horizon.

Life changing!!

*Thank you,
Stephen (ED - Patient / AZ)*
